

FACTS ABOUT LOWLINES

- ❖ Lowlines are compact, moderate frame beef cattle about 60% the size of other beef breeds. All registered Lowlines are DNA tested and parent verified to ensure consistent quality, time after time.
- ❖ Lowlines come in red and black. They are naturally polled and known for their docile temperament.
- ❖ Lowline cows have small, highly vigorous calves, requiring less assistance and resulting in lower cow and calf mortality.
- ❖ Lowline cows and bulls are known for their fertility and longevity in the herd, often producing well into their teens.
- ❖ Lowlines are highly feed efficient, requiring less feed, performing and finishing well on a grass fed diet.
- ❖ Lowline beef is known for its superior quality: well marbled, tender and full of flavor.
- ❖ Lowlines reduce your costs and increase profit. You can stock more animals per acre and replace them less frequently. They require less feed. It takes fewer people to work the cattle and calves can be easily and safely handled in the field.

DOING MORE WITH LESS!

- ❖ Feed Efficient Prime Beef from Heritage Cattle
- ❖ Raise more beef per acre
- ❖ Low Birth Weights & Easy Calving
- ❖ Docile Temperament
- ❖ 100% DNA Tested
- ❖ Reduce costs

LOWLINE CATTLE

**LOWLINE CATTLE ARE
100% HERITAGE
ABERDEEN ANGUS
GENETICS – DNA TESTED
& PARENT VERIFIED**

Lowlines are highly marketable beef cattle, known for heavy muscling, ease of calving and quiet dispositions. They are highly feed efficient which allows them to easily convert lower quality feeds into high quality meat. These attributes combined with their moderate size, offer a unique benefit to BOTH the commercial cattleman and the small acreage farmer.

THE LOWLINE ADVANTAGE

Australian Lowline Cattle are a highly versatile breed of beef cattle suitable for a wide variety of owners and uses. DNA testing of every registered animal provides consistent quality and results, time after time.

Lowlines can profitably produce beef at any scale from the small acreage farmer to the largest commercial herd. Their moderate size results in fewer environmental impacts making them ideal for sustainable and lifestyle farming. The Lowline efficiency in feed conversion is unsurpassed and results in high quality carcasses from a grass fed diet.

Lowline bulls are being used over all breeds of beef and dairy heifers and cows to reduce birth weights and improve calving success. Both Lowline bulls and cows are known for their fertility and longevity in the herd, often producing offspring well into their teens.

The docile and easy to manage temperament of Lowlines makes them highly desirable for every cattle owner, from the commercial rancher to the family farmer. In addition to traditional cattleman; women, children and seniors worldwide are raising and enjoying the benefits of Australian Lowline Cattle.

HISTORY OF LOWLINES

Lowline Cattle were developed from champion Aberdeen Angus stock imported to the Trangie Research Center in Australia from Canada in 1929, followed by the periodic introduction of selective genetics from the United States, England and Scotland until 1974 when the herd became closed. The research which produced the Lowline breed began in 1974 and continued for many years, confirming that selectively bred moderate frame cattle were more efficient converters of grass into meat. In the 1990's these animals were offered for sale, a stud book was created and the Lowline breed was established.

Smaller Frame, Bigger Profit!

COMMERCIAL USE OF LOWLINES

Australian Lowline cattle are now being used in large commercial beef operations worldwide.

Lowline cattle when crossed with other commercial beef breeds have the ability to increase fat cover and marbling, produce steers that finish well on grass and yield high value carcasses. Lowline bulls are being used by both large scale commercial beef breeders and dairy farmers for first time calving heifers to reduce calving difficulties.

Commercial producers are also using Lowline bulls to produce crossbred replacement heifers and moderate their herd frame size. These cattle are more feed efficient and grow and finish well on grass which is sought after in today's beef market. They also produce more than 30% more calf weight per acre compared to traditional commercial cattle.
